

Nitwits
Teton Range
WY
Elevation: 9711 ft
Aspect: 52°
Specifics: We skied slope

Jackson Knoll
12/09/2018 - 11:03am
Co-ord: 43.79212N, -110.93495W
Slope Angle: 38°
Wind Loading: previous

Stability: HS:133
Air Temperature: -2°C
Sky Cover: CLR
Precipitation: NO
Wind: Calm

Layer Notes:
60-53cm: Problematic layer

Notes: Dug near the top of Nitwits, 20 yards below and skier's left of the standard entrance. This part of the slope likely did not release during the November 25th avalanche cycle whereas further down (mid slope and skier's left) did release after that loading event. Structure is relatively poor yet stability is relatively good right now. Phil dug a hasty pit further down near the suspected location of the November 25th crown and got an ECTX result.
