

Stability: Fair Unstable **HS:**180 **Layer Notes:**
Air Temperature: -7°C 70-50cm:Problematic layer
Sky Cover: X
Precipitation: S1
Wind:

Specifics: Recent avalanche activity on similar slopes; Recent avalanche activity on different slopes; Snowmobile tracks on slope

Notes: The layer at 110 was breaking, but I could not isolate the grain type responsible for this. This is the only pit with this instability. I am thinking it is an isolated weakness.
