 Co-ord: 47.74216N, -121.07394E
 Slope Angle: 25°
 Wind Loading: previous

Stability:
 Air Temperature: 6°C
 Sky Cover: CLR
 Precipitation: NO
 Wind: E Light Breeze

HS:255
 PS: 12
 23-24cm: Problematic layer
 97-98cm: 2/24 crust
 106-126cm: Early Febuary Crust

Notes: All, "very wet," slush layers were various old/new interfaces. This would indicate pooling water. Water was not in fact pooling or percolating down into the snowpack. These interfaces were simply melting quickly when exposed to the warm ambient temperature and solar radiation. If you kept carving the outer layer of the pit away, you could get to moist grains before they would quickly melt and turn into slush. After the negative deep tap test, I inserted my shovel as a modified shovel shear test. The column, "Popped," out as a sudden planer very easy result at the Early February Crust.
