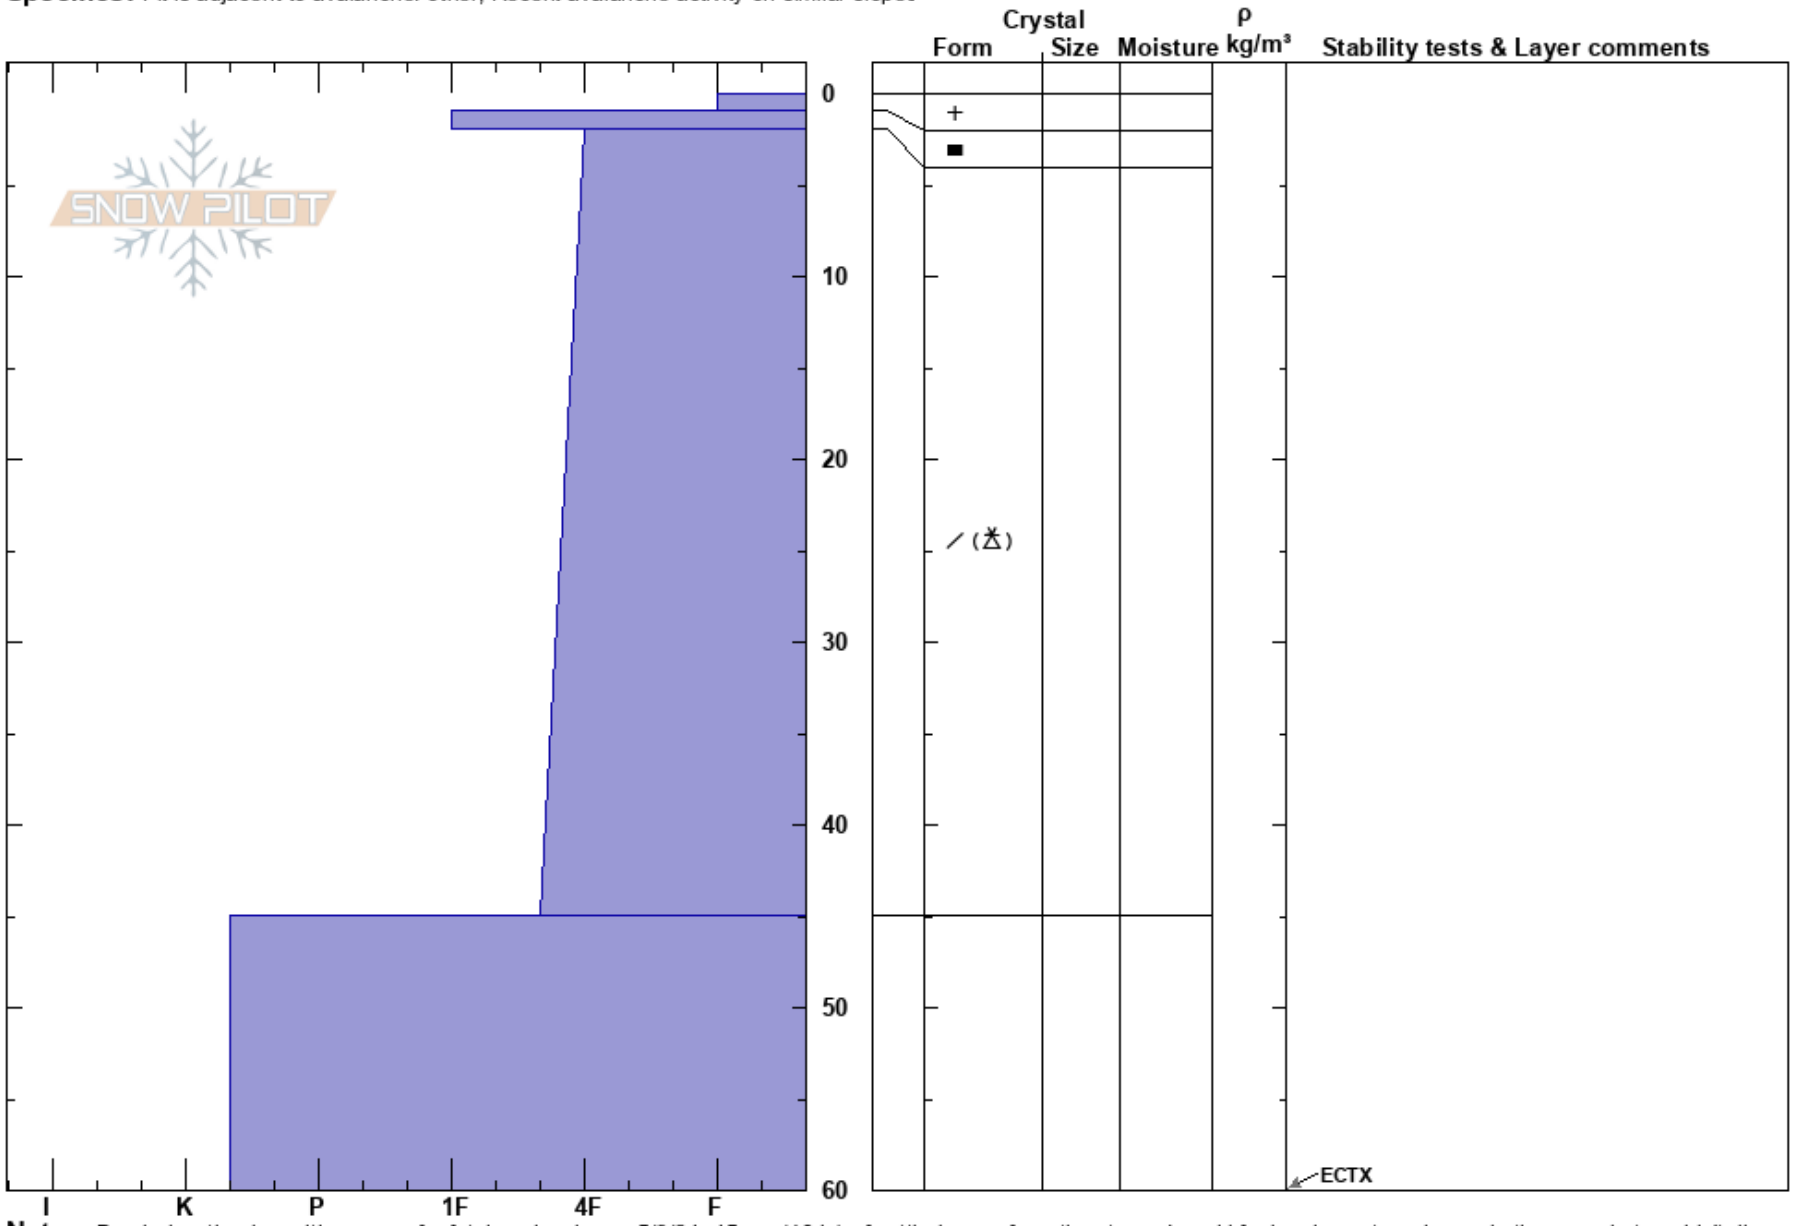
Co-ord: 40.53376N, -111.76375W
Slope Angle: 15°
Wind Loading: no

Stability:
Air Temperature:
Sky Cover: FEW
Precipitation: NO
Wind: E Light Breeze

Layer Notes:
2-45cm: Problematic layer

Specifics: Pit is adjacent to avalanche: other; Recent avalanche activity on similar slopes



Notes: Dug below the deposition area of a fatal avalanche on 5/9/24. 45 cm (18 in) of settled snow from the storm. I could feel various storm layers in the snow but couldn't discern a notable hardness difference. No red flags observed except for the fatal avalanche and one triggered by explosives in the terrain above.
