 Slope Angle: 37°
 Wind Loading:

Stability: Good
 Air Temperature: 15°F
 Sky Cover: CLR
 Precipitation: NO
 Wind: Calm

HS:110
 Layer Notes:
 43-40cm: BSH=10mm, Facets=1mm
 43-40cm: Problematic layer

Specifics: Pit is adjacent to avalanche: crown; Ski tracks on slope

Notes: Crown profile location was 30' from the trigger point. Weak layer involved was a combination of surface hoar and near surface facets buried by a storm over New Year's. This avalanche was triggered on Feb.3 on the skin track by the 9th and 10th people to ascend the route. No one caught or injured.
