 Slope Angle: 37°  
 Wind Loading:

Stability: Good  
 Air Temperature: 15°F  
 Sky Cover: CLR  
 Precipitation: NO  
 Wind: Calm

HS:110  
 Layer Notes:  
 43-40cm: BSH=10mm, Facets=1mm  
 43-40cm: Problematic layer

Specifics: Pit is adjacent to avalanche: crown; Ski tracks on slope

**Notes:** Crown profile location was 30' from the trigger point. Weak layer involved was a combination of surface hoar and near surface facets buried by a storm over New Year's. This avalanche was triggered on Feb.3 on the skin track by the 9th and 10th people to ascend the route. No one caught or injured.
