 Wind:

HS:121  
 Layer Notes:  
 63-61cm: dirt/dust layer  
 61-48cm: Problematic layer

**Notes:** Ran the sled above the pit wall several times. Nothing would crack which tells me it's hard to start a collapse in the weak layer. ECT results and recent avalanche activity tells me it's possible and when it does, the facets under the dust will propagate a crack really far.
