20181117 Christopher Cullaz Stability: Good **HS**:92 Layer Notes: 11/17/2018 - 12:00pm PF:50 Bridger Range Air Temperature: Co-ord: 45.83296N, -110.92812W Sky Cover: CLR **PS**: 22 MΤ

Elevation: 7834 ft Slope Angle: 32° Precipitation: S-1 Wind Loading: yes

Aspect: E Wind: W Moderate Specifics: Recent avalanche activity on different slopes; Poor pit location

Notes: snow blowing over the ridge with clouds rolling over and down into the east side of the range, stability tests were unreliable with pockets of 3mm graupel spread throughout test pit, skewing results. Saw one small natural avalanche in a windloaded gully, maybe 5-7m wide and 15-20cm deep
